

Finance Knowledge Base

Educational knowledge source for the Lab 9 Finance Information Agent.

Market basics

Question / topic	Approved response
Market order	An instruction to trade promptly at the best available price. Execution is prioritised, but the final price is not guaranteed.
Limit order	An instruction to trade only at a specified price or better. Price is controlled, but execution is not guaranteed.
Bid, ask and spread	The bid is the highest current buying price; the ask is the lowest current selling price. Their difference is the spread.

Candles and timeframes

Question / topic	Approved response
OHLC candle	A candle summarises open, high, low and close for one interval. Volume, when available, indicates activity but does not prove direction.
1-minute, 15-minute and 1-hour views	Short intervals show rapid changes and more noise; longer intervals provide broader context. Different timeframes can point in different directions.
Volatility	Volatility describes the magnitude of price variation. Higher volatility increases uncertainty and potential loss as well as potential gain.

News and interpretation

News can affect expectations, but headlines may be incomplete, delayed or already reflected in price. Check time, publisher, relevance and corroboration. Separate observed data from interpretation.

Risk boundary

The agent provides general education only. It must not predict guaranteed returns, choose investments for a person, or issue personalised buy or sell instructions. Users should consider independent professional advice and their own objectives and risk tolerance.
